AGENT ARENA 2026 · DEEPDIVE TRACK

DeepDive

Research you can check.

A multi-agent research analyst that publishes a claim only when it can tie it to an exact source quote.

Krish Naik Academy · powered by Mesh API

THE PROBLEM

A claim without evidence is a risk.

In a bid, every statement has to be backed by something you can point to. AI research tools often skip that step. They answer fluently, and the reader is left to trust them.

DeepDive asks the bid manager’s question of every AI answer: can we prove this?

WHAT IT DOES

Every claim has to earn its place.

01

Quote

Each claim carries the exact sentence it relies on, copied from a stored source.

02

Verify

A separate agent checks that the quote exists and that the passage really supports the claim.

03

Exclude openly

A claim the source only partly backs stays out of the report, and the rejection stays on the record.

HOW IT IS BUILT

Six agents, one job each.

01
Planner
Splits the question into subquestions.

02
Collector
Searches the web and fetches pages.

03
Drafter
Writes claims that quote passages.

04
Verifier
Confirms each quote and its support.

05
Assessor
Judges whether each requirement is answered.

06
Reporter
Shows only verified claims.

A bounded correction loop goes back for more evidence when a requirement is still open, inside hard limits on requests, searches, page fetches, tokens and time. Every model call goes through Mesh API.

A RECORDED RUN

Git merge vs. Git rebase

“How do Git merge and Git rebase differ in their effect on commit history, and when should a developer choose each?”

8
sources collected, 3 cited by a claim

4
verified claims in the report

12 of 12
requirements assessed as addressed

20
model requests, 0 failed

“Addressed” is a model assessment, not a guarantee. 199.7 of 300 seconds used. No cost is shown, because none is stored with the run.

THE MOMENT THAT MATTERS

DeepDive left out its own claim.

> “A fast-forward merge in Git does not create a merge commit and instead moves the branch pointer forward, resulting in a linear history that hides parallel development.”

Partially supported **Not currently report-eligible**

The cited passages support only part of the claim, so it stays out of the report. It is listed under “Eligible claims left out” with the reason, so the rejection stays on the record.

AUDIT TRAIL

Every step is recorded.

Agent	Requests	Failed
planner	1	0
researcher	8	0
relevance	1	0
drafter	1	0
verifier	5	0
coverage	2	0
consistency	1	0
synthesizer	1	0
Total	20	0

Sources, passages and quotes are stored exactly as retrieved.

Claims, verdicts and coverage are kept per version, including rejected ones.

Every model call is logged, with token counts as the provider returned them.

Cost appears only if it was stored. None was, so none is shown.

EVALUATION, STATED PLAINLY

What has been measured, and what has not.

Measured so far

12 reviewed claims: the verifier agreed with the reviewed labels on 9, under an earlier verifier rubric.

Two end-to-end pilot questions and a six-case answer-relevance check with one follow-up.

Limits

Small, AI-assisted review, not independent or blinded. One domain, no held-out set yet.

The demo shows recorded runs, not live research. PDFs are unsupported.

Partial and empty reports are kept and labelled, not hidden.

CHECK IT YOURSELF

Research you can check.
